#### I. DEMOGRAPHIC AND LAND USE ANALYSIS

### A. Population Characteristics and Their Implications for Evacuation Dynamics

#### 1. Overall Population<sup>1</sup>

In February 2007, the University of Florida's Bureau of Economic and Business Research (BEBR) estimated that the permanent resident population of Monroe County on April 1, 2006, was 80,510 (Table IC-1a), up by only 921 (1.2%) from the 2000 Census. Almost a third of the county population was in the City of Key West (31.4%), located at the end of the long string of islands connected to the mainland by US 1. The Florida Keys, which have been designated an Area of Critical State Concern, have been under growth restrictions since 1992 due to environmental constraints and high hurricane evacuation clearance times. BEBR projects the population will remain essentially constant, reaching 80,663 in 2010 and 80,844 in 2015. Some recent evidence suggests that a growing number of existing residential units are being converted to seasonal use, which could lead to an actual decrease in the permanent resident population in the County in the coming years.

#### 2. Group Quarters Population

In 2000, there were 1,355 Monroe County residents living in group quarters (1.7% of the population); 879 of these were institutionalized in correctional facilities, nursing homes, and juvenile institutions, while the other 476 were in other group quarters, such

<sup>1</sup> Population estimates and projections customarily distinguish between the *permanent resident population* in a jurisdiction (people who reside in the location year-round or at least half of the time) and the *seasonal population* (people who reside in the location only a portion of the year or who are visitors,

data for the 27 smallest counties in the State of Florida – in those counties, the 2006 tables will show "N.A." in all cells. Note that the annual ACS is collected for a much smaller sample than the 2000 Census, resulting in much larger margins of error. In addition, there are differences in the methodology that can affect the meaning of the data collected. As a result, comparisons should be made with caution. In some cases, although 2006 ACS data was tabulated for a county, the small sample size resulted in insufficient data to fill all of the cells in a given table – in those cases, the 2006 tables will show "N.A." in

\_

selected cells.

such as tourists). The permanent resident population is further broken into those who reside in *households* (occupied housing units) and those who are in *group quarters*, such as correctional facilities, nursing homes, military quarters, group homes, etc. The decennial census and the Census Bureau's new American Community Survey (ACS) present results for the permanent resident population, but not for the seasonal population. However, both the census and the ACS present data on vacant housing units, including those that are for seasonal use. Typically, local jurisdictions use these seasonal housing unit estimates, along with hotel and motel inventories, to prepare estimates and projections of the seasonal population for planning purposes. The estimates and projections prepared by the University of Florida's Bureau of Economic and Business Research (BEBR) also refer to the permanent resident population. Most of the data presented in this section is drawn from the sample portion of the 2000 Census of Population and Housing (Summary File 3) and from the 2006 ACS. The latter was tabulated only for the 40 counties that had a 2006 population of at least 65,000 permanent residents, so there is no 2006 ACS.

as college dormitories, group homes and military quarters (Table IC-11a and Map P5). The remaining 78,234 residents lived in households. In 2006, the group quarters population had decreased to a little over 900, or 1.2% of the total (Table IC-11b). This is slightly over half the State of Florida average of 2.3% in 2006.

#### 3. Housing Units by Type

Of the 51,617 housing units in Monroe County at the time of the 2000 Census, 46.9% were single-family, 32.6% were multi-family, and the other 20.5% were mobile homes, boats, recreational vehicles (RVs) or others used as dwelling units (Table IC-4a). Among all units, 16,531 (32.0%) were vacant (Map H2), with the highest vacancy rates found among multi-family buildings and mobile homes. Mobile homes, boats and RVs are a much larger component of the housing stock in Monroe than elsewhere in the region and than in the State of Florida as a whole, where 12.0% of all units were classified in this category. Maps H5 and H6 show that mobile homes, boats and RVs were spread throughout the Florida Keys in 2000. According to the 2006 ACS (Table IC-4b), the total number of housing units in the County increased by 3.5% in the first six years of the decade (less than 2,000 new units) – growth management controls limit the overall increase in residential units in Monroe County. In the same period, the number of vacant units rose by 23.3% to over 20,000 (38.2% of the total). The proportion of single-family units rose to 49.1% while the proportion of multi-family units rose to 35.5%. In the same period, the number of mobile homes, boats, recreational vehicles and other units declined from 10,593 to just over 8,000 (15.5% of the total).

#### 4. Occupied Housing Units (Households)

There were 35,086 occupied housing units (households) in Monroe County in 2000, 62.4% of which were occupied by owners and 37.6% by renters (Table IC-4a). The ownership ratio in Monroe is below the State of Florida average of 70.1%. By 2006 (ACS), the number of households had fallen by almost 6% to just over 33,000, while the proportion of owner-occupied units rose to 66.3% (Table IC-4b).

#### 5. Household Size

In 2000, the average household size (number of persons per occupied unit) in Monroe County was 2.23 (Table IC-5a and Map H4), which was significantly lower than the State of Florida average of 2.46. Renters, who are mostly concentrated in multi-family units, had a slightly lower household size (2.15) than owners (2.27), who are more heavily concentrated in single-family units. The average household size of 2.24 in 2006 (Table IC-5b) was basically unchanged for Monroe County, and remained lower than the State of Florida as a whole (2.47).

#### 6. Seasonal Dwelling Units

In 2000 there were 12,628 vacant dwelling units in Monroe County that were for seasonal, recreational or occasional use (Table IC-6a and Map H1), representing 24.5% of all units. High concentrations of vacant seasonal units were found throughout the Florida Keys (Map H3). By 2006 (Table IC-6b) this number had increased by 21% to over 15,000 units (28.6% of the total). According to licensing records of the Florida

Department of Business and Professional Regulation (Table IC-3), in 2007 there were 32 hotels with 2,704 rooms, 148 motels with 5,080 rooms, and 52 bed and breakfast inns with 484 rooms in Monroe County. Together, these units house a seasonal population that is in addition to the permanent resident population estimated above. Considering that all of these units are in vulnerable areas, the proportion of seasonal units and hotel/motel units that are occupied at any point in time will have an important impact on the total population that may participate in an evacuation.

#### 7. Vehicles per Household

There were 3,137 Monroe County households in 2000 that had no vehicle (8.9%), corresponding to 17.2% of all renter households but only 4.0% of owner households (Table IC-7a). This represents a significant number of households that could need transportation assistance in the event of a major evacuation. These households are concentrated more in the Lower Keys and Key West than elsewhere (Map H8). Between 2000 and 2006 (Table IC-7b), the number of households with no vehicle increased by almost 500 to 3,600 (10.9%). Map H9 shows the location of households with a large number of vehicles in 2000. The number of households with 2 or more vehicles fell from 17,191 in 2000 to under 16,000 in 2006, and the total number of vehicles in households decreased to 49,000, down more than 5,000 in 6 years (Tables IC-8a and IC-8b). The average number of vehicles per household in Monroe County fell slightly from 1.56 to 1.50 between 2000 and 2006, which could contribute to reduced congestion on the highways in evacuation scenarios.

#### 8. Age Composition

In 2000, the population of Monroe County included 11,577 people who were at least 65 years old (14.6% of the total population), which was below the proportion of elderly for the State of Florida as a whole (17.6%). Almost a quarter of these elderly residents (2,710) lived alone (Table IC-11a and Maps P6 and P7). At the same time, Monroe County's 13,450 children (under 18) were only 16.9% of the total (Table IC-9a), compared to 22.7% in the State of Florida. The median age in Monroe County in 2000 (42.6) was significantly above the state average (38.7). By 2006 (Table IC-9b), the elderly population (65+) had increased by over 700, to 16.5% of the total population, and the number of elderly living alone had increased to almost 3,000 (Table IC-11b). During the same period, the number of children under 18 fell by almost 1,000. In 2006, only about 8,500 Monroe County children were of school age (5 to 17 years old), down from 10,162 in 2000.

#### 9. Race / Ethnicity

The Hispanic or Latino population in Monroe County, which includes those born abroad as well as those born into Hispanic families in the United States, was made up of 12,500 residents (15.7% of the total population) in 2000 (Table IC-10a). This is a lower proportion of Hispanics than elsewhere in the South Florida region. Still, the Hispanic population in the county increased by over 1,000 in the first 6 years of this decade, to 18.1% of the total (Table IC-10b). The Non-Hispanic Black or African American population, which in South Florida includes many people from the Caribbean and Central and South America, is also smaller in Monroe County than in the rest of the region, and

it experienced only modest growth in the last 6 years, from 4.5% of the total in 2000 to 5.0% in 2006.

#### 10. Place of Birth and Citizenship

In 2000, 14.7% of Monroe County residents (13,732) were born abroad (Table IC-12a and Map P11), a substantially lower proportion than found in the other counties of South Florida. By 2006 (Table IC-12b), the foreign-born population had fallen to a little more than 10,000 (13.8%). The majority (69.2%) of these foreign-born residents came from the Caribbean and Central and South America – in 2000, 40.5% (4,751) were from Cuba. More than half of the foreign-born residents in 2000 (6,728) were not citizens (Map P10), a number which fell to about 5,000 in the first six years of this decade. Over half of Monroe County residents in 2000 (58.8%) were born in other parts of the United States, and the remaining 26.4% were born somewhere in the State of Florida, proportions which remained roughly the same in 2006.

#### 11. Linguistic Isolation

The level of linguistic isolation in Monroe County (households where no one 14 years or older speaks English "very well") is not significant. In 2000, 1,572 households (4.5%) were classified as linguistically isolated (Table IC-13a and Map P9). However, in the majority of these households (83.1%) Spanish was spoken – considering the availability of radio and television broadcasts in Spanish, as well as many service providers who speak Spanish, the inability to speak English very well is not a severe problem. There were only 265 linguistically isolated households in 2000 where a language other than Spanish was spoken (Map P8). This number is estimated to have fallen to under a hundred in 2006 (Table IC-13b).

#### 12. Labor Force

In 2000, only 35.1% of the population 16 years old and over of Monroe County was not in the labor force (Table IC-15a and Map P14); this was well below the share of the inactive population in the State of Florida as a whole (41.3%). The unemployment rate in Monroe County (3.1%) in 2000 was much lower than in the State of Florida (5.5%); this difference has been observed for much of the recent past, and is related to the difficulty of finding employees to fill jobs due to the high cost of living in the Florida Keys. By 2006, the inactive population in Monroe County had risen to 37.9% (Table IC-15b), compared to 38.6% in the State of Florida.

#### 13. Poverty Status

There were 7,977 Monroe County residents in 2000 (Table IC-16a) that lived in households with incomes below the poverty level (10.2% of the total population). Poverty rates were slightly higher among children (12.2%), but only 8.8% of elderly residents lived below the poverty level (Map P16). The overall poverty rate rose between 2000 and 2006 (Table IC-16b), to 11.6%, and the rates for children (15.5%) and the elderly population (10.0%) also rose. The poor elderly, especially those living alone, may represent a significant portion of those households without vehicles, which constitutes a substantial challenge for evacuation planning.

#### 14. Small Area Dwelling Unit and Population Data

Monroe County does not produce periodic small area dwelling unit and household counts for the entire county. Annual population estimates for Monroe County as a whole and for each of its municipalities (and the unincorporated County) are published by both the Census Bureau and the University of Florida's Bureau of Economic and Business Research (BEBR). BEBR also annually publishes projections of Monroe County's total population out to 2035.

The dwelling unit counts and population estimates and projections by census block group required for the transportation analysis had to be developed by working with each jurisdiction separately. For unincorporated Monroe County, Islamorada and Marathon, dwelling unit counts by type from the 2000 Census were established as the starting point, and building permits and certificates of occupancy were reviewed and allocated to census block groups to determine the changes in dwelling units as of mid-2010. Key Colony Beach and Layton provided dwelling unit counts for early 2010, which in each case are located within a single census block group. The City of Key West provided dwelling unit estimates by type as of the end of 2009, and these were allocated to census block groups in accordance with the proportions observed in the 2000 Census.

Geo-coded data from the lodging licensing database of the Florida Department of Business and Professional Regulation, Division of Hotels and Restaurants, was used to estimate the number of hotel and motel rooms as of early 2010 for use in the small area data. In addition, geo-coded data from the mobile home and recreational vehicle park database of the Florida Department of Health, Division of Environmental Health was used to confirm changes in the number of mobile homes in the Florida Keys.

In 1975, the Florida Legislature designated the Florida Keys, including its municipalities, an Area of Critical State Concern (ACSC) under Section 380.021, Florida Statutes. Following changes to the statutes, Monroe County was re-designated an ACSC in 1979. In 1981, the City of Key West was removed from the Florida Keys ACSC, but it was re-designated as a separate ACSC in 1984. In 1992, Monroe County put growth controls in place in the unincorporated County to limit the number of new residential units that can be built, in response to concerns about the environmental impacts of additional development in the Florida Keys and the County's ability to safely evacuate the population for storm events. Similar restrictions have been implemented in the municipalities as well. The dwelling unit allocations that have been in place for the last decade were used as the basis for extending the projected number of dwelling units from 2009 to 2010, and then out to 2015.

In light of the importance of the estimate of evacuation clearance times for Monroe County, Council staff met with representatives of the County, its municipalities and the Florida Department of Community Affairs, Area of Critical State Concern staff to review the draft small area dwelling unit counts and to review and finalize other model parameters (occupancy rates, persons per household, vehicles per household, vehicle usage rates).

#### B. Future Land Use Analysis

Monroe County has an estimated land area of 638,100 acres, or 997 square miles (see Table IC-17). This includes both the mainland portion of the County and the Florida Keys, the long string of islands extending 110 miles from Key Largo southwest to the City of Key West. If the water area of 1.75 million acres is included, Monroe County grows to almost 2.4 million acres, the largest of the three counties in South Florida.

Most of mainland Monroe County is within the boundaries of Everglades National Park and Big Cypress National Preserve. The County also is home to the Florida Keys National Marine Sanctuary, created to protect North America's only coral reef, the third largest coral reef system in the world. In addition, Monroe County includes Dry Tortugas National Park, four national wildlife refuges (Great White Heron, National Key Deer, Key West and Crocodile Lake) and ten state parks, which help to preserve habitat for over 30 threatened and endangered species. Together, these and other areas account for the 590,000 acres in Monroe County that have been set aside for conservation, leaving approximately 47,400 acres of land area for other uses. The County's five municipalities account for 14,355 acres, a little over 2% of the total land area.

Residential future land uses account for 34,727 acres, while non-residential uses total 10,596 acres. Recreation and open space and agriculture account for the remaining 2,075 acres.

Table IC-1a. <sup>&</sup>lt;sup>3</sup> A housing unit is a house, an apartment, a mobile home, a group of rooms, or a single room occupied (or if vacant, intended for occupancy) as separate living quarters. Separate living quarters are those in which the occupants live separately from any other people in the building and that have direct access from the outside of the building or through a common hall. Both occupied and vacant housing units are included in the housing unit inventory. Boats, recreational vehicles (RVs), vans, tents, and the like are housing units only if they are occupied as someone's usual place of residence. Vacant mobile homes are included provided they are intended for occupancy on the site where they stand. Vacant mobile homes on dealers' lots, at the factory, or in storage yards are excluded from the housing inventory. Also excluded from the housing inventory are quarters being used entirely for nonresidential purposes, such as a store or an office, or quarters used for the storage of business supplies or inventory.

\_

Vacancy status and other characteristics of vacant units were determined by census enumerators obtaining information from landlords, owners, neighbors, rental agents, and others. Vacant units for seasonal, recreational, or occasional use are vacant units used or intended for use only in certain seasons, for weekends, or other occasional use throughout the year. Seasonal units include those used for summer or winter sports or recreation, such as beach cottages and hunting cabins. Seasonal units also may include quarters for such workers as herders and loggers. Interval ownership units, sometimes called shared-ownership or time-sharing condominiums, also are included in this category. Vacant migrant worker units include those intended for occupancy by migrant workers employed in farm work during the crop season. (Work in a cannery, a freezer plant, or a food-processing plant is not farm work.)

Race and ethnicity are separate categories in both the 2000 Census and the 2006 American Community

.

Survey (ACS). For each person the surveys included two separate questions. The first asks whether each person in the household considers himself/herself to be of Hispanic or Latino origin (ethnicity). The second asks each person in the household to identify one or more racial categories that should be used to classify his/her racial makeup. Both questions request the respondent to classify himself/herself, rather than having a Census Bureau employee assign a classification. The tables presented here are cross-tabulations of the two characteristics. Race is tabulated into three categories: (1) White persons who identified only one race (White alone); (2) Black or African American persons who identified only one

race (Black or African American alone); and (3) persons of other races who identified only one race (Other race alone) <u>and</u> those who identified two or more races, combined into a single category. For each race category, the totals were calculated for those who indicated that they were of Hispanic or Latino origin and those who indicated that they were not.

<sup>&</sup>lt;sup>8</sup> A household includes all of the people who occupy a housing unit. (People not living in households are classified as living in group quarters.) A family includes a householder and one or more other people living in the same household who are related to the householder by birth, marriage or adoption. All people in a household who are related to the householder are regarded as members of his or her family. A family household may contain people not related to the householder, but those people are not included as part of the householder's family in census tabulations. Not all households contain families since a household may be comprised of a group of unrelated people or of one person living alone (nonfamily households).

<sup>&</sup>lt;sup>9</sup> A household in which no person 14 years old and over speaks only English and no person 14 years old and over who speaks a language other than English speaks English "very well" is classified as "linguistically isolated." In other words, a household in which all members 14 years old and over speak a non-English language and also speak English less than "very well" (have difficulty with English) is "linguistically isolated." All the members of a linguistically isolated household are tabulated as linguistically isolated, including members under 14 years old who may speak only English.

10

<sup>&</sup>lt;sup>10</sup> The data on disability status were derived from answers to two long-form questionnaire items. The first was a two-part question that asked about the existence of the following long-lasting conditions: (a) blindness, deafness, or a severe vision or hearing impairment (sensory disability) and (b) a condition that substantially limits one or more basic physical activities, such as walking, climbing stairs, reaching, lifting, or carrying (physical disability). This question was asked of a sample of the population 5 years old and over. The second was a four-part question that asked if the individual had a physical, mental, or emotional condition lasting 6 months or more that made it difficult to perform certain activities. The four activity categories were: (a) learning, remembering, or concentrating (mental disability); (b) dressing, bathing, or getting around inside the home (self-care disability); (c) going outside the home alone to shop or visit a doctor's office (going outside the home disability); and (d) working at a job or business (employment disability). Categories (a) and (b) were asked of a sample of the population 5 years old and over; (c) and (d) were asked of a sample of the population 16 years old and over. For data products that use a disability status indicator, individuals were classified as having a disability if any of the following three conditions were true: (1) they were 5 years old and over and had a response of "yes" to a sensory, physical, mental or self-care disability; (2) they were 16 years old and over and had a response of "yes" to going outside the home disability; or (3) they were 16 to 64 years old and had a response of "yes" to employment disability.

<sup>&</sup>lt;sup>11</sup> In response to evidence suggesting that mail respondents reported certain disabilities in error in the 2000 Census and in the initial years of the ACS, the Census Bureau introduced changes to the ACS questionnaire starting in 2003. Initial review of the data shows that the question redesign had the expected effect on mail respondents, lowering the rates of disability overall by reducing over-reporting in go-outside-home disability and employment disability after the change. This change affected primarily the respondents in the age range from 16 to 64 years, and makes comparisons between results of the 2000 Census and the 2006 ACS inappropriate. The 2006 ACS is believed to have more reliable results.
